

Model Group Sustainability Report 2023

Model Group Sustainability Report

Nowadays, companies' actions are judged by how sustainable they are. The idea of 'sustainability' itself was born as far back as 1713, within the context of a national wood shortage. A managed approach to forestry was the norm by the time Model came into being in 1882, and the uncontrolled exploitation of our forests was a thing of the past.

As a result, sustainability is part of Model's history. It is part of who we are, and it is part of our present. In our eyes, it's not something that's located in the future, even though we do set targets for it. We believe that being sustainable means being switched-on and alert, continuously making improvements, whether big or small – without being forced to. It's something genuine and natural. The joy we gain from leveraging hidden potential puts a smile on our faces day in, day out, enriching our actions in a sustainable way.

Our sustainability ratings

We actively participate in a wide array of ESG ratings. Such ratings demonstrate transparency of Model's sustainability strategy.

We want to set goals we can actually reach.

Our actions are based on set values and clear rules. We are convinced that environmental laws and economic laws go hand in hand: they are two sides of the same coin. This belief feeds into our vision and gives rise to the goals we want to reach.

We also make sure nothing is lost in the process of reaching these goals. Waste is something we do not want, particularly in the midst of the bureaucratic pressure that comes in the wake of ever-increasing compliance requirements. We act carefully, precisely, truthfully and attentively, and create value. We accept responsibility towards our customers, partners, employees and the environment, and create value.

Letter from the CEO: Mainstream or sustainability?

It is strange: Sustainable would be if everyone worked on strengthening their immune system and could react more calmly to the latest developments in the pandemic market, which would strengthen the immune system again. Instead, fear is cultivated, which also spreads virally, weakening the immune system and creating the market for vaccinations with emergency approvals in the first place.

It becomes particularly strange when fear is made big in the climate issue and sustainability is propagated simultaneously - such is this currently dominant spirit: creating so much confusion with a lot of contradiction that everyone gratefully grasps at the order-creating straw of politics. We, however, are pleased that we have been active in the circular economy for 140 years and have good prospects for the future. Joy is what lasts, and it does so better than many a currency. Even our central bank is constantly creating new money out of nothing. The corresponding counterpart of the work has not yet been done and the savers are expropriated by manipulated money prices - in this case, negative interest rates. A currency cannot last if it is torn between state monopoly money and global currency markets and if its citizens ask themselves why they have to work for money when they can do it at the push of a button. Inflation has therefore existed for decades, but it has only been noticed since it went through the roof.

This country is surrounded by countries that are part of a currency experiment that is politically motivated and out of touch with reality. Shortly after the introduction of the euro, a debtor country becomes the world's export champion because its currency is weaker than the one that suits it. And other countries from the South have to be «rescued» with massive transfer payments because the currency is stronger than it naturally should be and too cheap, thus tempting them into debt. The European Central Bank threatens further «bailouts, at any cost». Meanwhile, almost all central banks are covering their respective domains with a form of monetary socialism. This lowers the inhibition threshold to deprive citizens of their freedom of trade and commerce when a pandemic arises. The over-indebtedness of the public sphere thus spreads to the private sphere as well. It is to be feared that the confusion of money and capital will continue until, with the money floodgates fully open, capital is completely consumed by a rent-seeking society. In the context of such damaged, i.e. parasitic and non-learning societies, the longing for sustainability must grow - and this is cause for hope!

As an employee in a company that is in its 140th year of operation, I am more committed to sustainability than to the loud call to report on it. So I admit to doubting the sustainability of the push for a sustainability report. Isn't this precisely an issue we should keep quiet about to be able to do more? After all, the truth will come out eventually.

But that presupposes a basic trust that is being chased away today by sowing fear from every corner. Whoever propagates silence is already suspicious. Our strange times thus manage to reverse the saying «Talk is silver, silence is gold». With the increasing pressure for reports of all kinds, do we want to be led to believe that silver is worth more than gold? How glad I am that the price signals from the worldwide interaction of supply and demand prove the popular saying right and not the zeitgeist!

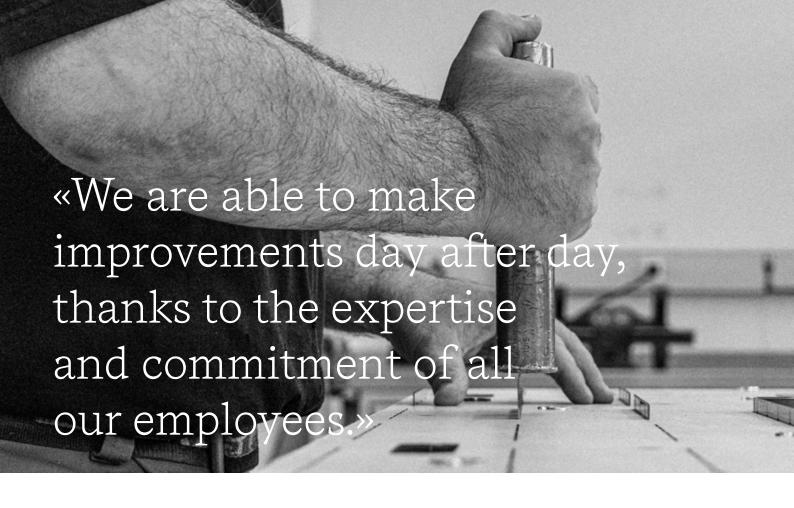

The speech noise could be also fed by the fact that the mouth is permanently indignant about its numerical inferiority compared with the two ears. How gladly it follows the seduction of equality with the consequence that both sides suffer. The mouth must say more than it is predisposed to say, so that sounds emerge there that are empty, unreflected, discordant, stammering, or lying. And the ears have to hear more than they can bear and begin to shut down. Strangely many look forward to the weekend, the «home office» and the vacations to be able to «switch off».

And my final confession: I can write all I want here; I've given in to the pressure to produce a sustainability report primarily because I can keep it short: Our constant transformation of the old, the used, and the discarded into the new, the beautiful, and the important are illustrative of sustainable value creation par excellence. It helps us in our perceived appreciation for customers, employees, fellow human beings, indeed life, the world, and creation in general. For us, economy and ecology come from the same family.

Weinfelden in June 2022

my

Daniel Model

Responsibility

Taking action against climate change

We, too, contribute to global warming. But we are also doing a lot to combat it. In addition to countless measures already implemented, we have committed to reducing greenhouse gas emissions in accordance with the Paris climate agreement. This commitment is based on the SBTi (Science Based Target initiative) standard, which lasts until 2030 and sets the path towards net zero. Furthermore, we report annually with CDP Climate Change.

The Model Group

Sustainability across generations

We develop, manufacture and supply high-quality display and packaging solutions made of cardboard and corrugated board.

As a family-run company, we have been dealing with the challenges of the present and the future for several generations. Since we want our sustainable fundamentals to stay that way, ongoing changes, improvements, and adjustments to the most effective points are necessary; in terms of individual integrity, the paper cycle, product quality, resource efficiency, supply chain, occupational safety, and our employees.

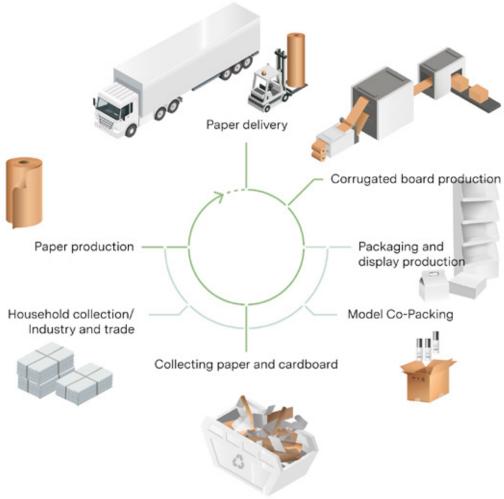

Integrity

Innate sustainability

We do not act sustainably in order to receive certificates, even though we have them. We do not act sustainably in order to comply with the law, even though we do. We act sustainably because it's in our nature to do so. The same is true of our deep-seated desire for constant improvement: we go beyond what the law stipulates or what's necessary to meet requirements. We write our own laws.

Our Code of Conduct acts as a guideline for responsible corporate behaviour relating to social, environmental, and economic matters. It is based on the UNGC (United Nations Global Compact) 10 principles. The UNGC is a global alliance between international companies and the UN and aims to shape globalization at a social and ecological level.

We use the SEDEX (Supplier Ethical Data Exchange) online platform to provide up-to-date information on the status of our processes related to sustainability – and our customers can also access it. We have been audited under the SMETA (Sedex Members' Ethical Trade Audit) procedure, which looks at issues such as environmental management, working conditions, occupational safety and hygiene.

Closed paper cycle

Our contribution to the Circular Economy

We produce our products within a closed paper cycle. This was the principle our company was founded on in 1882, and even back then people realized that collection and recycling of recovered paper offered benefits of both a financial and environmental nature. Since then, we have never stopped trying to optimize this cycle.

Nowadays, more than 80% of our packaging is made of recycled material. If our customers request virgin fibre, we source it from Europe or the US. We can produce our products from 100% FSC-certified fibre FSC (Forest Stewardship Council) fibres at all our factories.

Our actions

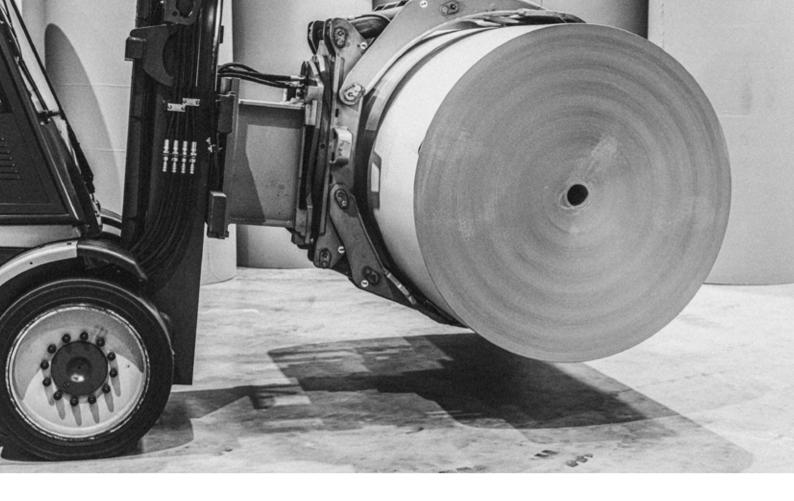

Sharing responsibility

Every action we undertake has an effect. If we want to understand these effects, we must identify and understand complex connections, some of which are not all that obvious.

We can rely on our customers to provide inspiration in this regard. They motivate us and challenge us, day in, day out, thanks to their high expectations of our products and services.

Our employees also drive forward our ability to come up with innovations. They have the freedom to put their skills into practice independently. This freedom allows them to unleash their potential so they can discover opportunities, take the initiative and make bold decisions.

Model Lean System

We make light work of...

...being a sustainable partner. Our Model Lean System helps us create leaner and more agile and stable processes.

Our processes are quick and efficient and continuously optimized. We aim to achieve the highest security, quality, supply reliability, and added value for our customers.

With every change we make, we strive to achieve resource-friendly growth, while also minimizing any undesirable effects on the environment, society, and our colleagues.

Reporting Approach

This Sustainability Report covers 2017 to 2021.

This Sustainability Report encompasses all the activities and key figures of every company within the Model Group.

This report has been drafted in compliance with the GRI standards, 'Core' version. The Sustainability Report itself has not been reviewed by an external expert.

GRI disclosures

Documentation of GRI indicators

This report complies with the Global Reporting Initiative (GRI) standards and aligns the key aspects of the GRI with the four pillars of the Model Group's sustainability strategy.

A love for quality

We think products can be used without second-guessing if they strip down the amount of material used to the bare essentials. We think packaging can be used without second-guessing if it is stable and protects its contents. It is about using materials that are still food-grade even though they will not end up in foodstuffs, with hygiene measures that meet or

exceed international standards. Essentially, our products can be used without second-guessing once we have managed to put your mind at rest, ensuring that they bring you joy, not a concern. In short, our ambition is actually for you to be happy – second-guess that!

1. Our ambition

We transform the old, the used into the new and the beautiful

Packaging is an indispensable part of value chains, whether local or global. We have packaging to thank for the fact that food stays fresh for longer and can be stored for longer periods of time. Packaging enables goods to be portioned and measured with precision. It also allows goods to be stacked up, makes them easier to handle, helps space to be used efficiently during transport, and facilitates automation in the packaging process. And the most important thing? It ensures goods get to their destination in one piece.

Packaging is a platform for content and branding, and ultimately its design and style influence whether a shopper decides to buy a particular product. Packaging is important, there's no question about it. But it also impacts our environment. That is why we not only look at the merits and disadvantages of packaging, we also focus on the development and in particular the quality of our products.

2. Our actions

We are tough on ourselves

We monitor the quality of every manufacturing process on an ongoing basis. All key information relating to the production chain is documented in a policy statement that stretches from warehouse conditions to traceability, through to certification and additives.

As part of this, we work with certified quality processes and management systems. We use cutting-edge technology in our labs and in the production of food-grade additives. Our customers audit our factories regularly, and their input gives us invaluable ideas for optimization and innovation.

We put ourselves to the test

All our factories are certified to ISO 9001 for quality management. The manufacturing plants for foodstuffs packaging are certified in line with the BRC Global Packaging standard for product safety. Most retail chains prescribe this as a binding standard for suppliers of primary and secondary food packaging.

But that is not enough for us. Experienced auditors from independent, external certification bodies not only play a role in ensuring compliance with standards, we also benefit from invaluable regular discussions with them, which help us continue to improve our processes. Our Weinfelden site is particularly worth highlighting: it's received the AA classification for high-quality hygiene standards under the **BRC Global Standard Packaging.**

Enjoy your food without a second thought

Alongside paper and corrugated board, we also work with inks, coatings, and adhesives – and they must be used with special care when it comes to food packaging.

As a result, at Model we use only materials that do not taint the food with harmful substances. They do not affect the smell, taste, or chemical composition of the packaged goods. We insist on proof from our suppliers to guarantee that all the substances in our products meet our strict requirements.

Our products are safe for consumers.

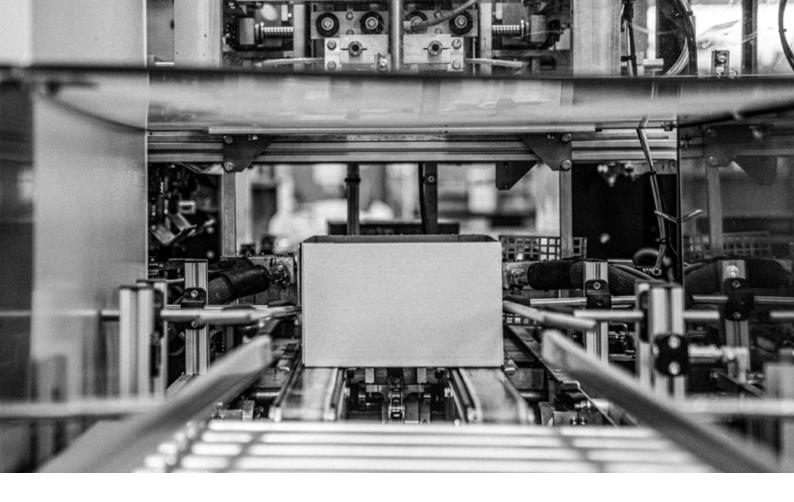

Spick and span

Much of our packaging makes its way into food manufacturers' cleanrooms. That is why hygiene is of the utmost importance to us. In our eyes, hygiene is more than a guideline: it is a fundamental principle. We impart this principle to our employees on a routine basis, along with unequivocal instructions. In turn, this creates habits such as our employees eating and drinking only in break rooms and not smoking on company premises.

The demands we place on ourselves are the same ones we place on our suppliers and visitors. And we always ensure that the only people in our manufacturing spaces are those authorized to be there.

When it comes to product safety, we comply with the following international standards and develop them further if required:

- GMP (Good Manufacturing Practice)
- BRC Global Standard Packaging Materials
- HACCP (Hazard Analysis and Critical Control Points).

We back people - and machines

We always try to reduce the number of points where errors could arise. Automation of plants and manufacturing processes is a key tool for doing this.

We use automation to reduce the room for errors caused by inattentiveness and carelessness. Automation not only boosts the quality of our products, it also reduces waste.

Automation can be a long and complex task, but it motivates our engineers and process experts and pushes them on to do great things.

3. Our goals

By 2030, all our plants will have implemented a recognized product safety system. We will reach this goal thanks to stable processes and by making ongoing improvements to ensure our manufacturing is as precise and error-free as possible.

We will reduce (or maintain) our complaints rate, lead time, and delivery service while increasing productivity. We will achieve this goal through targeted investment in new technology and highly qualified employees.

GRI information

Documenting GRI indicators

This report complies with the Global Reporting Initiative (GRI) standards and aligns the key aspects of the GRI with the four pillars of the Model Group's sustainability strategy.

GRI 416-1 – 416-2, 417-1 Customer health and safety

The awareness of closing gaps

Closed material cycles are the key to climate neutrality. We do our best to recycle as much recovered paper as possible.

We always use recycled fibre wherever possible, playing our part in protecting our forests. If we cannot avoid the use of virgin fibre, we purchase it from FSC-certified sources. Illegal logging does not occur at any point in our supply chain, and damaging chemicals are not used at any stage.

In terms of logistics, we avoid journeys with empty lorries. We use water in a circular fashion and our paper factories have their own wastewater treatment plants. We collect used packaging from our customers, recycle it and turn it into new packaging.

1. Our ambition

As little packaging as possible

But as much as necessary. Unlike other materials such as plastic, our board and corrugated board mean that goods can be wrapped in eco-friendly packaging. There is no doubt that the manufacture of cardboard is a high-energy and water-intensive process.

We handle resources carefully and efficiently – and not just in terms of energy, the climate, waste, and water. We investigate issues such as deforestation, soil erosion, and illegal logging when procuring raw materials.

2. Our actions

We prefer used goods

Our products are resource-intensive, by their very nature. That is why recycling and energy-efficient manufacturing are at the top of our agenda, from both an environmental and economic perspective.

We analyse, anticipate and reduce the negative effects on the environment as soon as we start the development of a product. We optimise our logistics on an ongoing basis, whether with route planning and innovations or by using return trips to bring back waste paper and cardboard.

We purify wastewater, use recycled fibre where possible and buy only certified virgin fibre, where we need it.

New vehicle fleet and a premium system

Model Logistics in Germany renewed its vehicle fleet from 2019-2021.

In 2019, 63 vehicles were replaced, in 2020 45 vehicles, and in 2021 the last 10 vehicles were replaced with more efficient Scania and MAN models.

In July 2019, the Roadlox software was also introduced with which the driving behavior of drivers is evaluated. At the same time, a bonus system based on this assessment was introduced.

These two measures reduced average fuel consumption from 24.07 I/100km to 22.93 I/100km. With around 12.5 million annual kilometers driven, this is a saving of around 142 500 I of diesel.

Shortened transport routes

In November 2021, a corrugator was launched in Nowa Sól (PL). The realization of a project of this dimension is a great challenge, but we are proud to say that it was completed successfully on schedule. The result is a modern and high-performance machine that guarantees high-quality of produced corrugated sheets.

Thanks to the new corrugator, we no longer need to transport approximately five million $\rm m^2$ of sheets per month from Czosnów to Nowa Sól. Thereby, we save time, transport costs and reduce $\rm CO_2$ emissions. The installation paves the way for Model's further growth in Poland.

Heat recuperation

In 2021, Model Obaly in Hostinné (CZ) realized another stage of using the waste heat from three compressors. We use compressors for the central distribution of air to our production machines. During the air generation, waste heat of about 70°C is generated.

Currently, the heating of the plant is ensured by a distribution system, which was created by interconnecting the original and the new distribution system. Thus, we are able to use the waste heat throughout the plant. In addition, we have shut down the heat supply from the supplier and can renew it at any time if necessary. This investment is also pleasing in economic terms, as the investment amounted to only CHF 25 000.

The 100% recovery of waste heat brought us savings in heat supply costs of CHF 27 000 in the first four months of 2022. We expect the total annual savings to be 400 MWh or CHF 45 000.

Highest efficiency

The multi-motor drives of the paper machines PM1 and PM2 in Weinfelden (CH) were completely renewed with new motors and gearboxes. Motors of energy efficiency classes IE4 and very low-loss gear-

boxes were used to achieve maximum energy savings. Thanks to maximum efficiency, 350 MWh/a can be saved at PM1 and 900 MWh/a at PM2. This corresponds to the annual electricity consumption of 250 households.

3. Our goals

What we want to achieve

By 2030, we will have reduced our resource consumption per tonne of paper, corrugated board, and cardboard produced by 10%.

To reach these goals, we will optimize our fibre recovery process, improve our logistics and introduce new technology along the value chain.

Always energizing and inciting

The Model Group does not have employees: it has partners. We are home to strong individuals who forge connections by working together to create our vision and make it a reality. This unifying goal is the inspiration behind all our activities and is our most precious asset. It turns our employees into partners, ensuring everyone takes personal responsibility for their own actions.

1. Our ambition

We protect, challenge and support

Professional occupational safety is a cornerstone of successful, people-focused companies. That is why we do everything we can to avoid accidents and occupational illness.

We offer targeted support to talented employees and offer further development opportunities, coaching, and training while supporting and encouraging personal responsibility. Our employees know the importance and value of their contribution to ensure we reach our goals. For us, trust is a form of capital, and the best way to grow it is with honesty.

2. Our actions

Safety does not mean anything...

...if you do not trust anyone. That is why we carry out regular training sessions on occupational safety, review corporate processes on an ongoing basis and analyze systematic errors

We use the Model Lean System across our factories. This involves the integration of all our employees into an internally audited occupational safety and management system, with every accident and near-miss registered and analyzed. Plus, our employees come forward immediately if they notice a safety issue.

We carry out regular 'GEMBA walks', where we identify risks in the workplace. GEMBA is a Japanese term meaning 'the actual place', 'the real place' or 'the place where value is created'.

We are working towards certification of all our factories under ISO 45001. Occupational safety plays a big role in this; for example, correct operation of machines.

Young people are the future

In 2021, we trained 59 apprentices and were by their side as they entered the world of work. At the Model Group, an appealing working environment, top-quality training, and exciting internships lay the foundation for the talent of the future.

Find more information about our apprenticeships.

The career boost you need

We set great store by our employees' training and professional development. We undertake regular hands-on coaching sessions to hone the skillsets of our specialists and managers.

We entrust projects to our young, talented employees so they can prove themselves within a fixed framework. In turn, young workers at every company within the Model Group can draw on the knowledge of many generations of employees: some of our colleagues have been working for our company for 20 years or more.

And if we do not have the necessary expertise ourselves, we help our employees take up external training and professional development opportunities with funds from our employer-financed foundation. In 2020, we offered assistance to the tune of almost EUR 1 million.

MODEL Your Dreams

Corporate Social Responsibility (CSR) assumes that companies have social interests at heart and be valuable not only to explicit stakeholders but also to the local community. CSR is not a necessity but a conscious choice of companies actively taking care of their environment. Model Opakowania in Poland is exactly doing that for many years already.

One of our sponsoring initiatives is a competition called «MODEL Your Dreams». Since 2013 it has been organized in Biłgoraj, and since 2016 in Czosnów.

The basic idea of the contest is to support young, ambitous talents. Young people get inspired to pursue their passions and dreams, in order to determine an auspicious future and hence career path.

Approximately 150 young people have taken part since the beginning, and for many of them winning became a motivation to stand up for themselves and their future. A holistic success which has given the participants a tailwind.

3. Our goals

What we want to achieve

By 2030, we want to reduce the number of accidents in the workplace across the entire group.

To achieve this, we have deployed the ISO 45001 occupational safety system at every Model Group site. Our new concept for handling hazardous substances is also part of this.

GRI information

Documenting GRI indicators

This report complies with the Global Reporting Initiative (GRI) standards and aligns the key aspects of the GRI with the four pillars of the Model Group's sustainability strategy.

GRI 403-1 – 403-8 Occupational safety and health

GRI 404-2 Education and training

Cherry picking for the benefit of our customers

After all, we have plenty of partners. 1800 small, medium-sized and large companies supply their goods to us and support us with services. We select each one carefully to ensure that they share our values, and review the quality and safety of their products. In our procurement conditions, we clearly state that our supply chain must meet exemplary demands, from start to finish.

1. Our ambition

Ties that stand the test of time

We are fastidious in our selection of suppliers, particularly in the area of paper procurement. Given that paper makes up the largest proportion of our procurement volume across the Group, we know every single one of our suppliers. We are in constant communication with each of these partners and carry out regular audits.

As soon as quality is no longer up to scratch and is not improved, we call it a day.

2. Our actions

If you have your eye on us, you must have plenty to offer

We source wood fibre (whether virgin or recycled), adhesives, inks, coatings, and much more from more than 1 800 partners across Europe. We are always more than happy to pick small companies to be our

partners. Our procurement conditions are clear and precisely worded, so it is easier for us to make and review our choice. Our supply chain is measured and judged on how these conditions are met.

Concentration of the supply chain

The acquisition of the paper mill in Eilenburg (Germany) further secures the upstream supply chain, i.e. paper production. Now Model Group can cover 100% of its own demand for recycled containerboard.

The geographical location of Eilenburg, close to other Model corrugated board mills, will also mean shorter transport distances than if the containerboard were supplied from Switzerland.

Our supply chains are stable

COVID and the Russian-Ukrainian war have challenged us. Due to the current situation, we analyze the most important supply chains daily and evaluate new suppliers if necessary. One of the most important

building blocks in the supply chain are our paper mills, which very reliably supply the raw material for corrugated board production. The supply chains have thus always been stable to date.

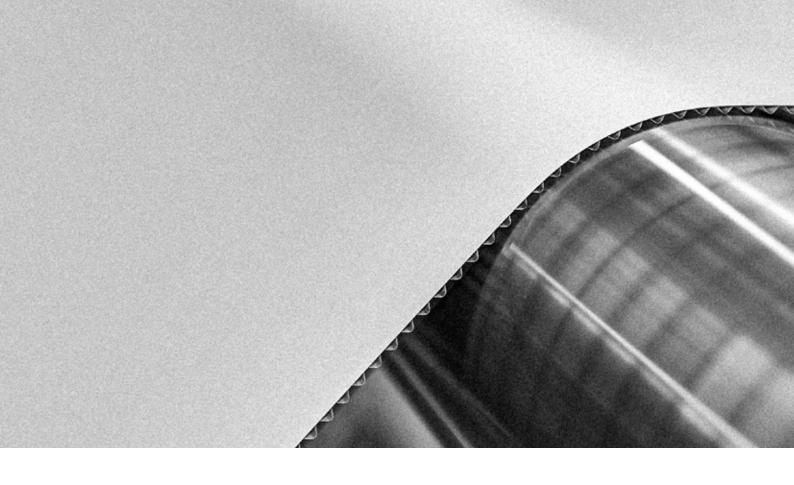

Keeping our wordand letting our actions speak louder

Within our General Terms of Procurement, our suppliers guarantee that they will adhere to the EU chemicals regulation REACH. They guarantee that they will comply with all applicable environmental legislation and the requirements of the Code of Conduct of the Business Social Compliance Initiative (BSCI). This includes a ban on discrimination and corruption, fair salaries, compliance with human rights and occupati-

onal health and safety standards. The Model Group's suppliers also undertake to continually improve manufacturing conditions, handle resources responsibly and protect the environment as best possible.

Our requirements also apply to our suppliers' suppliers

Our requirements also apply to our suppliers' suppliers, and to the Model Group's entire supply chain as a result.

No stone left unturned

We check our suppliers regularly. Part of this happens through the due diligence process of self-audits, but we also carry out audits ourselves. Paper is the most important component of our products. To emphasize the high expectations we have of our suppliers, we regularly conduct supplier re-audits at our major paper manufacturers. The topics we examine go beyond the minimum requirements for sustainability certifications, meaning that we also look at product quality, manufacturing processes, and employee training.

As we choose our suppliers carefully and in line with stringent requirements, it is rare that we need to reassess their environmental or social impact in depth. Most of our partners already meet very high standards when it comes to sustainability, but we aim to raise the bar even further.

The due diligence process below applies to direct procurement for production sites within Switzerland:

1. SELF-AUDIT

Every supplier, whether new or existing, carries out an annual self-audit using a Model questionnaire and has to supply the corresponding documentary evidence. We focus on reviewing the requirements listed in the General Terms of Procurement.

2. RISKS

We assess risk criteria across every relevant area and review whether the supplier, the product, or the service display critical issues.

3. MEASURES

If the supplier does not meet our requirements, we ask them to improve and report back.

4. PROGRESS

We then review whether the improvements meet our expectations and, in case of doubt, carry out an audit ourselves. If their progress is unsatisfactory, we bring our collaboration to an end.

3. Our goals

What we want to achieve

By 2030, we want all our direct suppliers to have achieved 'category A' in their self-audit. We use the following measures to consistently implement and enforce our sustainability requirements within the supply chain:

- Our sustainability requirements are put into practice across the entire Model Group and expanded to also cover the procurement of additives.
- We choose suppliers that already satisfy the demands of category A, or help them to get there.
- We are continuing to scale up supplier self-audits.

Glossary

CHF	Swiss franc
*employees	Individual who is in an employment relationship with Model, according to national law
FTE	Full Time Equivalent
GRI	Global Reporting Initiative
kWh	Kilowatt hour
m ³	Cubic meter
MCHF	Million swiss francs
Mm ²	Million square meters
** workers	Model worker who is not amployed by Model. This often concerns self-amployed persons and persons who are amployed by third parties, but who for example have a badge and workplace with Model.
